

Belnet

A/C System Flushing Fluid

BELNET is an inflammable, cleaning liquid specially formulated to flush the refrigeration lines.

BELNET removes all the residues of dust, grease and lubricants. Thanks to its high capability of evaporation it does not leave any remain inside the refrigerant lines. Furthermore it is particularly suitable for the retrofit operations, for the pre-cleaning of the predispositions, and for the washing of the pipes.

Before flushing, DISCONNECT the COMPRESSOR, THE EXPANSION VALVE and the DEHYDRATION FILTER: these components cannot be cleaned.

IT IS RECOMMENDED TO DO A RUBBING WASH WITH THE BIG DIMENSION SYSTEMS OR THE AUTOMOTIVE ONES.

Instructions: Insert **BELNET** in the plant or in the component to be washed, by using a washing tank or other manual, electric or pneumatic tools. Let **BELNET** circulate until the liquid will emerge from the part of the clean recovery. Flush the nitrogen to accelerate the evaporation of the product.

Dispose the liquid wash, in accordance to the current regulations.

BELNET must be used by an experienced operator, who has to be provided with the specific personal protective equipment.
